## DESCRIPTION

**TYGACIL** (tigecycline) is a glycylcycline antibacterial for intravenous infusion. The chemical name of tigecycline is (4*S*,4*aS*,5*aR*,12*aS*)-9-[2-(*tert*-butylamino)acetamido]-4,7-bis(dimethylamino)-1,4,4*a*,5,5*a*,6,11,12*a*-octahydro-3,10,12,12*a*-tetrahydroxy-1,11-dioxo-2-naphthacenecarboxamide. The empirical formula is C<sub>29</sub>H<sub>39</sub>N<sub>5</sub>O<sub>8</sub> and the molecular weight is 585.65.

The following represents the chemical structure of tigecycline:

**TYGACIL** is an orange lyophilized powder or cake. Each **TYGACIL** vial contains 50 mg tigecycline lyophilized powder for intravenous infusion. Each vial contains 100 mg of lactose monohydrate. The pH is adjusted with hydrochloric acid, and if necessary sodium hydroxide.

## CLINICAL PHARMACOLOGY

Anti-infective

Glycylcycline antibacterial

ATC code: J01C AA12

## Pharmacokinetics

The mean pharmacokinetic parameters of tigecycline after single and multiple intravenous doses are summarized in Table 1. Intravenous infusions of tigecycline were administered over approximately 30 to 60 minutes.

**Table 1. Mean (CV%) Pharmacokinetic Parameters of Tigecycline**

	Single Dose 100 mg	Multiple Dose <sup>a</sup> 50 mg q 12h
C <sub>max</sub> (µg/mL) <sup>b</sup>	1.45 (22%)	0.87 (27%)
C <sub>max</sub> (µg/mL) <sup>c</sup>	0.90 (30%)	0.63 (15%)
AUC (µg·h/mL)	5.19 (36%)	--
AUC <sub>0-24h</sub> (µg·h/mL)	--	4.70 (36%)
C <sub>min</sub> (µg/mL)	--	0.13 (59%)

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

$t_{1/2}$ (h)	27.1 (53%)	42.4 (83%)
CL (L/h)	21.8 (40%)	23.8 (33%)
CL <sub>r</sub> (mL/min)	38.0 (82%)	51.0 (58%)
V <sub>ss</sub> (L)	568 (43%)	639 (48%)

<sup>a</sup> 100 mg initially, followed by 50 mg every 12 hours

<sup>b</sup> 30-minute infusion

<sup>c</sup> 60-minute infusion

## Absorption

Tigecycline is administered intravenously, and therefore has 100% bioavailability.

## Distribution

The *in vitro* plasma protein binding of tigecycline ranges from approximately 71% to 89% at concentrations observed in clinical studies (0.1 to 1.0 µg/mL). Animal and human pharmacokinetic studies have demonstrated that tigecycline readily distributes to tissues. In rats receiving single or multiple doses of <sup>14</sup>C-tigecycline, radioactivity was well distributed to most tissues, with the highest overall exposure observed in bone, bone marrow, thyroid gland, kidney, spleen, and salivary gland. In humans, the steady-state volume of distribution of tigecycline averaged 500 to 700 L (7 to 9 L/kg), indicating tigecycline is extensively distributed beyond the plasma volume and into the tissues of humans.

Two studies examined the steady-state pharmacokinetic profile of tigecycline in specific tissues or fluids of healthy subjects receiving tigecycline 100 mg followed by 50 mg every 12 hours. In a bronchoalveolar lavage study, the tigecycline AUC<sub>0-12h</sub> (134 µg·h/mL) in alveolar cells was approximately 77.5-fold higher than the AUC<sub>0-12h</sub> in the serum of these subjects, and the AUC<sub>0-12h</sub> (2.28 µg·h/mL) in epithelial lining fluid was approximately 32% higher than the AUC<sub>0-12h</sub> in serum. In a skin blister study, the AUC<sub>0-12h</sub> (1.61 µg·h/mL) of tigecycline in skin blister fluid was approximately 26% lower than the AUC<sub>0-12h</sub> in the serum of these subjects.

In a single-dose study, tigecycline 100 mg was administered to subjects prior to undergoing elective surgery or medical procedure for tissue extraction. Tissue concentrations at 4 hours after tigecycline administration were measured in the following tissue and fluid samples: gallbladder, lung, colon, synovial fluid, and bone. Tigecycline attained higher concentrations in tissues versus serum in gallbladder (38-fold, n=6), lung (3.7-fold, n=5), and colon (2.3-fold, n=6). The concentration of tigecycline in these tissues after multiple doses has not been studied.

## Metabolism

Tigecycline is not extensively metabolized. In vitro studies with tigecycline using human liver microsomes, liver slices, and hepatocytes led to the formation of only trace amounts of metabolites. In healthy male volunteers receiving <sup>14</sup>C-tigecycline, tigecycline was the primary <sup>14</sup>C-labeled material recovered in urine and feces, but a glucuronide, an N-acetyl metabolite, and a tigecycline epimer (each at no more than 10% of the administered dose) were also present.

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

## **Elimination**

The recovery of total radioactivity in feces and urine following administration of <sup>14</sup>C-tigecycline indicates that 59% of the dose is eliminated by biliary/fecal excretion, and 33% is excreted in urine. Approximately 22% of the total dose is excreted as unchanged tigecycline in urine. Overall, the primary route of elimination for tigecycline is biliary excretion of unchanged tigecycline. Glucuronidation and renal excretion of unchanged tigecycline are secondary routes.

Tigecycline is a substrate of P-gp based on an in vitro study using a cell line overexpressing P-gp. The potential contribution of P-gp-mediated transport to the in vivo disposition of tigecycline is not known.

## **Special Populations**

### **Use in Patients with Hepatic Impairment**

In a study comparing 10 subjects with mild hepatic impairment (Child Pugh A), 10 subjects with moderate hepatic impairment (Child Pugh B), and 5 subjects with severe hepatic impairment (Child Pugh C) to 23 age- and weight-matched healthy control subjects, the single-dose pharmacokinetic disposition of tigecycline was not altered in subjects with mild hepatic impairment. However, systemic clearance of tigecycline was reduced by 25%, and the half-life of tigecycline was prolonged by 23% in subjects with moderate hepatic impairment (Child Pugh B). In addition, systemic clearance of tigecycline was reduced by 55%, and the half-life of tigecycline was prolonged by 43% in subjects with severe hepatic impairment (Child Pugh C).

Based on the pharmacokinetic profile of tigecycline, no dosage adjustment is warranted in subjects with mild to moderate hepatic impairment (Child Pugh A and Child Pugh B). However, in subjects with severe hepatic impairment (Child Pugh C), the dose of **TYGACIL** should be reduced to 100 mg followed by 25 mg every 12 hours. Subjects with severe hepatic impairment (Child Pugh C) should be treated with caution and monitored for treatment response (See **PRECAUTIONS, Use in Patients with Hepatic Impairment and DOSAGE AND ADMINISTRATION**).

### **Use in Patients with Renal Impairment**

A single-dose study compared 6 subjects with severe renal impairment (creatinine clearance  $\leq 30$  mL/min), 4 end stage renal disease subjects receiving tigecycline 2 hours before hemodialysis, 4 end stage renal disease subjects receiving tigecycline 1 hour after hemodialysis, and 6 healthy control subjects. The pharmacokinetic profile of tigecycline was not altered in any of the renally impaired subject groups, nor was tigecycline removed by hemodialysis. No dosage adjustment of **TYGACIL** is necessary in subjects with renal impairment or in subjects undergoing hemodialysis (See **DOSAGE AND ADMINISTRATION**).

### **Pediatric Use**

The pharmacokinetics of tigecycline in patients less than 18 years of age have not been established (See **PRECAUTIONS, Pediatric Use**).

### Geriatric Use

No overall differences in pharmacokinetics were observed between healthy elderly subjects (n = 15, age 65 – 75; n = 13, age > 75) and younger subjects (n = 18) receiving a single, 100 mg dose of **TYGACIL**. Therefore, no dosage adjustment is necessary based on age (See **PRECAUTIONS, Geriatric Use**).

### Gender

In a pooled analysis of 38 women and 298 men participating in clinical pharmacology studies, there was no significant difference in the mean ( $\pm$  SD) tigecycline clearance between women ( $20.7 \pm 6.5$  L/h) and men ( $22.8 \pm 8.7$  L/h). Therefore, no dosage adjustment is necessary based on gender.

### Race

In a pooled analysis of 73 Asian subjects, 53 Black subjects, 15 Hispanic subjects, 190 White subjects, and 3 subjects classified as “other” participating in clinical pharmacology studies, there was no significant difference in the mean ( $\pm$  SD) tigecycline clearance among the Asian subjects ( $28.8 \pm 8.8$  L/h), Black subjects ( $23.0 \pm 7.8$  L/h), Hispanic subjects ( $24.3 \pm 6.5$  L/h), White subjects ( $22.1 \pm 8.9$  L/h), and “other” subjects ( $25.0 \pm 4.8$  L/h). Therefore, no dosage adjustment is necessary based on race.

### Drug-drug Interactions

**TYGACIL** (100 mg followed by 50 mg every 12 hours) and digoxin (0.5 mg followed by 0.25 mg, orally, every 24 hours) were coadministered to healthy subjects in a drug interaction study. Tigecycline slightly decreased the  $C_{max}$  of digoxin by 13%, but did not affect the AUC or clearance of digoxin. This small change in  $C_{max}$  did not affect the steady-state pharmacodynamic effects of digoxin as measured by changes in ECG intervals. In addition, digoxin did not affect the pharmacokinetic profile of tigecycline. Therefore, no dosage adjustment is necessary when **TYGACIL** is administered with digoxin.

Concomitant administration of **TYGACIL** (100 mg followed by 50 mg every 12 hours) and warfarin (25 mg single-dose) to healthy subjects resulted in a decrease in clearance of R-warfarin and S-warfarin by 40% and 23%, and an increase in  $C_{max}$  by 38% and 43% and an increase in AUC by 68% and 29%, respectively. Tigecycline did not significantly alter the effects of warfarin on increased international normalized ratio (INR). In addition, warfarin did not affect the pharmacokinetic profile of tigecycline. However, prothrombin time or other suitable anticoagulation test should be monitored if tigecycline is administered with warfarin.

In vitro studies in human liver microsomes indicate that tigecycline does not inhibit metabolism mediated by any of the following 6 cytochrome CYP450 isoforms: 1A2, 2C8, 2C9, 2C19, 2D6, and 3A4. Therefore, **TYGACIL** is not expected to alter the metabolism of drugs metabolized by these enzymes. In addition, because tigecycline is not extensively metabolized, clearance of tigecycline is not expected to be affected by drugs that inhibit or induce the activity of these CYP450 isoforms.

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

In vitro studies using Caco-2 cells indicate that tigecycline does not inhibit digoxin flux, suggesting that tigecycline is not a P-glycoprotein (P-gp) inhibitor. This in vitro information is consistent with the lack of effect of tigecycline on digoxin clearance noted in the in vivo drug interaction study described above.

Tigecycline is a substrate of P-gp based on an in vitro study using a cell line overexpressing P-gp. The potential contribution of P-gp-mediated transport to the in vivo disposition of tigecycline is not known. Coadministration of P-gp inhibitors (e.g., ketoconazole or cyclosporine) or P-gp inducers (e.g., rifampicin) could affect the pharmacokinetics of tigecycline.

Concomitant use of tigecycline and calcineurin inhibitors such as tacrolimus or cyclosporine may lead to an increase in serum trough concentrations of the calcineurin inhibitors. Therefore, serum concentrations of the calcineurin inhibitor should be monitored during treatment with tigecycline to avoid drug toxicity.

## **Pharmacodynamic properties**

### **Mechanism of action**

Tigecycline, a glycylcycline antibiotic, inhibits protein translation in bacteria by binding to the 30S ribosomal subunit and blocking entry of amino-acyl tRNA molecules into the A site of the ribosome. This prevents incorporation of amino acid residues into elongating peptide chains. Tigecycline carries a glycyamido moiety attached to the 9-position of minocycline. The substitution pattern is not present in any naturally occurring or semisynthetic tetracycline and imparts certain microbiologic properties that transcend any known tetracycline-derivative *in vitro* or *in vivo* activity. In addition, tigecycline is able to overcome the two major tetracycline resistance mechanisms, ribosomal protection and efflux. However, in recent studies, resistance to tigecycline has been detected in Enterobacterales and other organisms, determined by an efflux pump mechanism and by mutations in a ribosomal protein. Tigecycline has demonstrated in vitro and in vivo activity against a broad spectrum of bacterial pathogens. There has been no cross resistance observed between tigecycline and other antibiotics. In in vitro studies, no antagonism has been observed between tigecycline and other commonly used antibiotics. In general, tigecycline is considered bacteriostatic. At 4 times the minimum inhibitory concentration (MIC), a 2-log reduction in colony counts was observed with tigecycline against *Enterococcus spp.*, *Staphylococcus aureus*, and *Escherichia coli*. However, tigecycline has demonstrated bactericidal activity against common respiratory strains of *Streptococcus pneumoniae*, *Haemophilus influenzae*, and *Legionella pneumophila*.

### **In Vitro Susceptibility of Bacteria to Tigecycline**

When available, the clinical microbiology laboratory should provide cumulative results of the in vitro susceptibility test results for antimicrobial drugs used in local hospitals and practice areas to the physician as periodic reports that describe the susceptibility profile of nosocomial and community-acquired pathogens. These reports should aid the physician in selecting the most effective antimicrobial.

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

For broth dilution tests for aerobic organisms, MICs must be determined using testing medium that is fresh (< 12 hours old). The disk diffusion procedure utilizes disks impregnated with 15 µg of tigecycline.

### EUCAST Reference Information

Minimum inhibitory concentration (MIC) and disk inhibition zone breakpoints established by the European Committee on Antimicrobial Susceptibility Testing (EUCAST) are as follows [The European Committee on Antimicrobial Susceptibility Testing]. Breakpoint tables for interpretation of MICs and zone diameters:

<b>Table 2. EUCAST Breakpoints</b>		
Pathogen	MIC (mg/L)	Inhibition zone diameter (mm)
	≤S (Susceptible)/ >R (Resistant)	≥S (Susceptible)/ <R (Resistant)
<i>Enterobacterales</i> (formerly <i>Enterobacteriaceae</i> ): <i>Escherichia coli</i> and <i>Citrobacter koseri</i> : <sup>(†)</sup>	≤ 0.5 / > 0.5	≥ 18 / < 18 <sup>(*)</sup>
<i>Staphylococcus</i> spp.	≤ 0.5 / > 0.5	≥ 19 / < 19
<i>Enterococcus faecalis</i>	≤ 0.25 / > 0.25	≥ 20 / < 20
<i>Enterococcus faecium</i>	≤ 0.25 / > 0.25	≥ 22 / < 22
<i>Streptococcus</i> groups A, B, and C	≤ 0.125 / > 0.125	≥ 19 / < 19
<b>PK/PD (non-species related)</b>		
	≤ 0.5 / > 0.5	-
<sup>(†)</sup> For other <i>Enterobacterales</i> , the activity of tigecycline varies from insufficient in <i>Proteus</i> spp., <i>Morganella morganii</i> and <i>Providencia</i> spp. to variable in other species.		
<sup>(*)</sup> Zone diameter breakpoints validated for <i>E. coli</i> only. For <i>C. koseri</i> use MIC method.		

For anaerobic bacteria there is clinical evidence of efficacy in polymicrobial intra-abdominal infections, but no correlation between MIC values, PK/PD data and clinical outcome. Therefore, no breakpoint for susceptibility is given.

Quality control ranges for EUCAST susceptibility testing are in the following table.

<b>Table 3. Acceptable Quality Control Ranges for Susceptibility Testing (EUCAST)</b>		
Organism	MIC range (mg/L)	Inhibition zone diameter range (mm)
<i>Escherichia coli</i> ATCC 25922	0.03-0.25	20-27
<i>Staphylococcus aureus</i> ATCC 29213	0.03-0.25	19-25
<i>Enterococcus faecalis</i> ATCC 29212	0.03-0.125	20-26
<i>Streptococcus pneumoniae</i> ATCC 49619	0.016-0.125	24-30

ATCC = American Type Culture Collection

Generic Name: Tigecycline

 Approved by BPOM: July 18, 2024

### PK/PD relationship

Limited animal data indicates that AUC/MIC is the pharmacodynamic index best related to outcome. Human pharmacodynamic studies indicate a relationship between AUC/MIC and clinical as well microbiological efficacy.

### Susceptibility

The prevalence of acquired resistance may vary geographically and with time for selected species, and local information on resistance is desirable, particularly when treating severe infections.

The information below provides only approximate guidance on the probability as to whether the microorganism will be susceptible to tigecycline or not:

Pathogen
<b>Commonly Susceptible Species</b>
<u>Gram-positive Aerobes</u> <i>Enterococcus</i> spp.† (including vancomycin resistant isolates) <i>Listeria monocytogenes</i> <i>Staphylococcus aureus</i> * (including methicillin resistant isolates) <i>Staphylococcus epidermidis</i> (including methicillin resistant isolates) <i>Staphylococcus haemolyticus</i> <i>Streptococcus agalactiae</i> * <i>Streptococcus pyogenes</i> * <i>Streptococcus pneumoniae</i> † Viridans group streptococci†
<u>Gram-negative Aerobes</u> <i>Aeromonas hydrophila</i> <i>Citrobacter freundii</i> * <i>Citrobacter koseri</i> <i>Escherichia coli</i> * <i>Haemophilus influenzae</i> * <i>Legionella pneumophila</i> * <i>Moraxella catarrhalis</i> * <i>Neisseria meningitidis</i> <i>Pasteurella multocida</i>
<u>Anaerobes</u> <i>Clostridioides difficile</i> <i>Clostridium perfringens</i> * <i>Peptostreptococcus</i> spp. † <i>Porphyromonas</i> spp. <i>Prevotella</i> spp.
<u>Other organisms</u> <i>Chlamydia pneumoniae</i>

<b>Pathogen</b>
<i>Mycobacterium abscessus</i> <i>Mycobacterium chelonae</i> <i>Mycobacterium fortuitum</i> <i>Mycoplasma pneumoniae</i>
<b>Species for which acquired resistance may be a problem</b>
<u>Gram-negative Aerobes</u> <i>Acinetobacter baumannii</i> <i>Enterobacter cloacae</i> * <i>Klebsiella oxytoca</i> * <i>Klebsiella pneumoniae</i> * <i>Serratia marcescens</i> <i>Stenotrophomonas maltophilia</i>  <u>Anaerobes</u> <i>Bacteroides fragilis</i> group† <i>Parabacteroides distasonis</i>
<b>Inherently resistant organisms</b>
<u>Gram-negative Aerobes</u> <i>Providencia</i> spp <i>Proteus</i> spp.
<p>*denotes species against which it is considered that activity has been satisfactorily demonstrated in clinical studies.</p> <p>†activity in clinical studies has been demonstrated for vancomycin-susceptible <i>Enterococcus faecalis</i>; penicillin-susceptible pneumococci; among viridans streptococci for the <i>Streptococcus anginosus</i> group (includes <i>S. anginosus</i>, <i>S. intermedius</i> and <i>S. constellatus</i>); among <i>Peptostreptococcus</i> spp. for <i>P. micros</i>; among <i>Bacteroides</i> spp. for <i>B. fragilis</i>, <i>B. thetaiotaomicron</i>, <i>B. uniformis</i>, <i>B. ovatus</i> and <i>B. vulgatus</i>.</p>

## INDICATIONS AND USAGE

**TYGACIL** is indicated for the treatment of the following infections caused by susceptible strains of the designated microorganisms:

Complicated skin and skin structure infections (cSSSI) caused by *Escherichia coli*, *Enterococcus faecalis* (vancomycin-susceptible isolates only), *Staphylococcus aureus* (methicillin-susceptible and -resistant isolates), including cases with concurrent bacteremia, *Streptococcus agalactiae*, *Streptococcus anginosus* grp. (includes *S. anginosus*, *S. intermedius*, and *S. constellatus*), *Streptococcus pyogenes*, *Enterobacter cloacae*, *Klebsiella pneumoniae*, and *Bacteroides fragilis*.

Complicated intra-abdominal infections (cIAI) caused by *Citrobacter freundii*, *Enterobacter cloacae*, *Escherichia coli* (includes ESBL producing isolates), *Klebsiella oxytoca*, *Klebsiella pneumoniae* (includes ESBL producing isolates), *Enterococcus faecalis* (vancomycin-susceptible isolates only), *Staphylococcus aureus* (methicillin-susceptible and -resistant isolates), including cases with concurrent bacteremia,

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

*Streptococcus anginosus* grp. (includes *S. anginosus*, *S. intermedius*, and *S. constellatus*), *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Clostridium perfringens*, and *Peptostreptococcus micros*.

Appropriate specimens for bacteriological examination should be obtained in order to isolate and identify the causative organisms and to determine their susceptibility to tigecycline. **TYGACIL** may be initiated as empiric monotherapy before results of these tests are known.

To reduce the development of drug-resistant bacteria and maintain the effectiveness of **TYGACIL** and other antibacterial drugs, **TYGACIL** should be used only to treat infections that are proven or strongly suspected to be caused by susceptible bacteria. When culture and susceptibility information are available, they should be considered in selecting or modifying antibacterial therapy. In the absence of such data, local epidemiology and susceptibility patterns may contribute to the empiric selection of therapy.

## CONTRAINDICATIONS

**TYGACIL** is contraindicated for use in patients who have known hypersensitivity to tigecycline.

## WARNINGS

An increase in all-cause mortality has been observed across phase 3 and 4 clinical studies in **TYGACIL** treated subjects versus comparator-treated subjects. In a pooled analysis of all 13 Phase 3 and 4 trials that included a comparator, death occurred in 4.0% (150/3788) of subjects receiving tigecycline and 3.0% (110/3646) of subjects receiving comparator drugs resulting in an unadjusted risk difference of 0.9% (95% CI 0.1, 1.8). In a pooled analysis of these trials, based on a random effects model by trial weight, an adjusted risk difference of all-cause mortality was 0.6% (95% CI 0.1, 1.2) between tigecycline and comparator-treated subjects. The cause of this increase has not been established. This increase should be considered when selecting among treatment options (See **PRECAUTIONS** and **ADVERSE REACTIONS**).

Anaphylactic reaction/anaphylactoid reactions have been reported with nearly all antibacterial agents, including tigecycline, and may be life-threatening.

Glycylcycline class antibiotics are structurally similar to tetracycline class antibiotics. Therefore, **TYGACIL** should be administered with caution in patients with known hypersensitivity to tetracycline class antibiotics. Due to the structural similarities of glycylcycline class antibiotics to tetracycline class antibiotics, similar adverse effects may include: photosensitivity, pseudotumor cerebri, pancreatitis, and anti-anabolic action (which has led to increased BUN, azotemia, acidosis, and hyperphosphatemia).

**TYGACIL** may cause fetal harm when administered to a pregnant woman. If the patient becomes pregnant while taking tigecycline, the patient should be apprised of the potential hazard to the fetus. Results of animal studies indicate that tigecycline crosses the placenta and is found in fetal tissues. Decreased fetal weights in rats and rabbits (with associated

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

delays in ossification) and fetal loss in rabbits have been observed with tigecycline (See **PRECAUTIONS, Pregnancy**).

The use of **TYGACIL** during tooth development (last half of pregnancy, infancy, and childhood to the age of 8 years) may cause permanent discoloration of the teeth (yellow-gray-brown). Results of studies in rats with **TYGACIL** have shown bone discoloration. **TYGACIL** should not be used during tooth development unless other drugs are not likely to be effective or are contraindicated.

Pseudomembranous colitis has been reported with nearly all antibacterial agents and may range in severity from mild to life-threatening. Therefore, it is important to consider this diagnosis in patients who present with diarrhoea subsequent to the administration of any antibacterial agent.

Treatment with antibacterial agents alters the flora of the colon and may permit overgrowth of clostridia. Studies indicate that a toxin produced by *Clostridium difficile* is the primary cause of “antibiotic-associated colitis”. After the diagnosis of pseudomembranous colitis has been established, therapeutic measures should be initiated. Mild cases of pseudomembranous colitis usually respond to drug discontinuation alone. In moderate to severe cases, consideration should be given to management with fluids and electrolytes, protein supplementation, and treatment with an antibacterial drug clinically effective against *C. difficile* colitis.

## **PRECAUTIONS**

### **General**

Caution should be exercised when considering tigecycline monotherapy in patients with complicated intra-abdominal infections (cIAI) secondary to clinically apparent intestinal perforation. In Phase 3 and 4 cIAI studies (n=2775), 140/1382 tigecycline-treated patients and 142/1393 comparator-treated patients presented with intestinal perforations. Of these patients, 8/140 patients treated with tigecycline and 8/142 patients treated with comparator developed sepsis/septic shock. The relationship of this outcome to treatment cannot be established.

Isolated cases of significant hepatic dysfunction and hepatic failure have been reported in patients being treated with tigecycline.

Pancreatitis acute, which can be fatal, has occurred (frequency: uncommon) in association with tigecycline treatment (See **ADVERSE REACTIONS**). The diagnosis of pancreatitis acute should be considered in patients taking tigecycline who develop clinical symptoms, signs, or laboratory abnormalities suggestive of pancreatitis acute. Cases have been reported in patients without known risk factors for pancreatitis. Patients usually improve after tigecycline discontinuation. Consideration should be given to the cessation of the treatment with tigecycline in subjects suspected of having developed pancreatitis.

Monitoring of blood coagulation parameters, including blood fibrinogen, is recommended prior to treatment initiation with tigecycline and regularly while on treatment (See **ADVERSE REACTIONS**).

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

The safety and efficacy of tigecycline in patients with hospital acquired pneumonia (HAP) have not been established. In a study of subjects with HAP, subjects were randomized to receive tigecycline (100 mg initially, then 50 mg every 12 hours) or a comparator. In addition, subjects were allowed to receive specified adjunctive therapies. The sub-group of subjects with ventilator-associated pneumonia (VAP) who received tigecycline had lower cure rates (47.9% versus 70.1% for the clinically evaluable population) and greater mortality (25/131 [19.1%] versus 14/122 [11.5%]) than the comparator. Of those subjects with VAP and bacteremia at baseline, those who received tigecycline had greater mortality (9/18 [50.0%] versus 1/13 [7.7%]) than the comparator.

As with other antibiotic preparations, use of this medicinal product may result in overgrowth of non-susceptible organisms, including fungi. Patients should be carefully monitored during therapy. If superinfection occurs, appropriate measures should be taken.

Prescribing **TYGACIL** in the absence of a proven or strongly suspected bacterial infection or a prophylactic indication is unlikely to provide benefit to the patient and increases the risk of the development of drug-resistant bacteria.

### **Information for Patients**

Patients should be counseled that antibacterial drugs including **TYGACIL** should only be used to treat bacterial infections. They do not treat viral infections (e.g., the common cold). When **TYGACIL** is prescribed to treat a bacterial infection, patients should be told that although it is common to feel better early in the course of therapy, the medication should be taken exactly as directed. Skipping doses or not completing the full course of therapy may (1) decrease the effectiveness of the immediate treatment and (2) increase the likelihood that bacteria will develop resistance and will not be treatable by **TYGACIL** or other antibacterial drugs in the future.

### **Drug Interactions**

Prothrombin time or other suitable anticoagulation test should be monitored if tigecycline is administered with warfarin (See **CLINICAL PHARMACOLOGY, Drug-drug Interactions**).

Concurrent use of antibiotics with oral contraceptives may render oral contraceptives less effective.

### **Drug/Laboratory Test Interactions**

There are no reported drug-laboratory test interactions.

### **Effect on Activities Requiring Concentration and Performance**

Tigecycline can cause dizziness (See **ADVERSE REACTIONS**), which may impair the ability to drive and/or operate machinery.

### **Carcinogenesis, Mutagenesis, Reproduction Toxicity**

Lifetime studies in animals have not been performed to evaluate the carcinogenic potential of tigecycline. No mutagenic or clastogenic potential was found in a battery of

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

tests, including *in vitro* chromosome aberration assay in Chinese hamster ovary (CHO) cells, *in vitro* forward mutation assay in CHO cells (HGRPT locus), *in vitro* forward mutation assays in mouse lymphoma cells, and *in vivo* micronucleus assay. Tigecycline did not affect mating or fertility in rats at exposures up to 4.7 times the human daily dose based on AUC. In female rats, there were no compound-related effects on ovaries or estrous cycles at exposures up to 4.7 times the human daily dose based on AUC.

In preclinical safety studies, <sup>14</sup>C-labeled tigecycline crossed the placenta and was found in fetal tissues, including fetal bony structures. The administration of tigecycline was associated with slight reductions in fetal weights and an increased incidence of minor skeletal anomalies (delays in bone ossification) at exposures of 4.7 times and 1.1 times the human daily dose based on AUC in rats and rabbits, respectively.

Results from animal studies using <sup>14</sup>C-labeled tigecycline indicate that tigecycline is excreted readily via the milk of lactating rats. Consistent with the limited oral bioavailability of tigecycline, there is little or no systemic exposure to tigecycline in the nursing pups as a result of exposure via the maternal milk.

### **Pregnancy**

Tigecycline may cause fetal harm when administered to a pregnant woman. Results of animal studies indicate that tigecycline crosses the placenta and is found in fetal tissues. Decreased fetal weights in rats and rabbits (with associated delays in ossification) have been observed with tigecycline.

Tigecycline was not teratogenic in the rat or rabbit (See **PRECAUTIONS, Carcinogenesis, Mutagenesis, Reproduction Toxicity**).

There are no adequate and well-controlled studies of tigecycline in pregnant women. **TYGACIL** should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. (See **WARNINGS**).

### **Labor and Delivery**

**TYGACIL** has not been studied for use during labor and delivery.

### **Lactation**

It is not known whether this drug is excreted in human milk. Available data in animals have shown excretion of tigecycline/metabolites in milk (See **PRECAUTIONS, Carcinogenesis, Mutagenesis, Reproduction Toxicity**). Because many drugs are excreted in human milk, caution should be exercised when **TYGACIL** is administered to a nursing woman (See **WARNINGS**).

### **Fertility**

The effects of tigecycline on fertility in humans have not been studied. Nonclinical studies conducted with tigecycline in rats do not indicate harmful effects with respect to fertility or reproductive performance (See **PRECAUTIONS, Carcinogenesis, Mutagenesis, Reproduction Toxicity**).

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

### Use in Patients with Hepatic Impairment

No dosage adjustment is warranted in patients with mild to moderate hepatic impairment (Child Pugh A and Child Pugh B). In patients with severe hepatic impairment (Child Pugh C), the dose of tigecycline should be reduced to 100 mg followed by 25 mg every 12 hours. Patients with severe hepatic impairment (Child Pugh C) should be treated with caution and monitored for treatment response (See **CLINICAL PHARMACOLOGY, Special Populations**, Use in Patients with Hepatic Impairment and **DOSAGE AND ADMINISTRATION**).

### Pediatric Use

Safety and effectiveness in pediatric patients below the age of 18 have not been established (See **WARNINGS**). Therefore, use in patients under 18 years of age is not recommended.

### Geriatric Use

In a pooled analysis of 3900 subjects who received tigecycline in Phase 3 and 4 clinical studies, 1026 were 65 and over. Of these, 419 were 75 and over. No unexpected overall differences in safety were observed between these subjects and younger subjects. No dosage adjustment is necessary in elderly patients.

## ADVERSE REACTIONS

Expected frequency of adverse reactions is presented in CIOMS frequency categories:

Very common	≥10%
Common	≥1% and <10%
Uncommon	≥0.1% and <1%
Rare	≥0.01% and <0.1%
Very rare	< 0.01%
Frequency not known	cannot be estimated from the available data

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

In Phase 3 clinical studies 2514 patients were treated with **TYGACIL**. **TYGACIL** was discontinued due to adverse events in 5.0% of patients compared to 4.7% for all comparators. Table 4 shows the incidence of treatment-emergent adverse reactions reported in ≥ 2% of patients in these studies.

**Table 4. Incidence (%) of Treatment-Emergent Adverse reactions Reported in  
≥ 2% of Patients Treated in Phase 3 Clinical Studies**

<b>Body System</b>	<b>TYGACIL<sup>a</sup></b>	<b>Comparator<sup>b</sup></b>
Adverse Events	(N = 2514)	(N = 2307)
<b>Body as a Whole</b>		
Abdominal pain	6.0	4.4

<sup>a</sup> 100 mg initially, followed by 50 mg every 12 hours

<sup>b</sup> Vancomycin / Aztreonam, Imipenem / Cilastatin, Linezolid

<sup>c</sup> LFT abnormalities in **TYGACIL**-treated patients were reported more frequently in the post therapy period than those in comparator-treated patients, which occurred more often on therapy.

In all Phase 3 and 4 studies that includes a comparator, death occurred in 4.0% (150/3788) of subjects receiving **TYGACIL** and 3% (110/3646) of subjects receiving comparator drugs. In a pooled analysis of these studies, the risk difference of all cause mortality was 0.9% (95% CI 0.1, 1.8) between tigecycline and comparator treated subjects. In a pooled analysis of these trials, based on a random effects model by trial weight, an adjusted risk difference of all-cause mortality was 0.6% (95% CI 0.1, 1.2) between tigecycline and comparator-treated subjects. No significant differences were observed between treatments by tigecycline and comparators by infection type (see Table 5). The cause of the imbalance has not been established. Generally, deaths were the result of worsening or complications of infection or underlying co-morbidities.

**Table 5: Subjects with Outcome of Death by Infection Type**

Infection Type	-Tigecycline -		-Comparator -		Risk Difference*
	n / N	%	n / N	%	
cSSSI	12/834	1.4	6/813	0.7	0.7 (-0.5, 1.9)

Overall Adjusted	150/3788	4.0	110/3646	3.0	0.6 (0.1, 1.2)**

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

CAP = Community-acquired pneumonia; cIAI = Complicated intra-abdominal infections; cSSSI = Complicated skin and skin structure infections; HAP = hospital-acquired pneumonia; VAP = ventilator-associated pneumonia; RP = resistant pathogens; DFI = diabetic foot infections.

\* The difference between the percentage of subjects who died in tigecycline and comparator treatment groups. The 95% CIs were calculated using the Wilson Score Method with continuity correction.

\*\* Overall adjusted (random effects model by trial weight) risk difference estimate and 95% CI.

<sup>a</sup> These are subgroups of the HAP population.

Note: The trials include 300, 305, 900 (cSSSI), 301, 306, 315, 316, 400 (cIAI), 308 and 313 (CAP), 311 (HAP), 307 [Resistant gram-positive pathogen study in subjects with MRSA or Vancomycin-Resistant Enterococcus (VRE)], and 319 (DFI with and without osteomyelitis).

The most common treatment-emergent adverse reactions in patients treated with tigecycline were nausea 29.9% (19.3% mild; 9.2% moderate; 1.4% severe) and vomiting 19.9% (12.1% mild; 6.8% moderate; 1.1% severe). In general, nausea or vomiting occurred early (days 1-2). Discontinuation from tigecycline was most frequently associated with nausea (1.6%) and vomiting (1.3%).

In patients treated for complicated skin and skin structure infections (cSSSI), nausea incidence was 35.0% for **TYGACIL** and 8.9% for vancomycin/aztreonam; vomiting incidence was 20.0% for **TYGACIL** and 4.2% for vancomycin/aztreonam. In patients treated for complicated intra-abdominal infections (cIAI), nausea incidence was 25.3% for **TYGACIL** and 20.5% for imipenem/cilastatin; vomiting incidence was 19.5% for **TYGACIL** and 15.3% for imipenem/cilastatin.

Discontinuation from tigecycline was most frequently associated with nausea (1.1%) and vomiting (1.1%). For comparators, discontinuation was most frequently associated with nausea (0.5%).

The following treatment-emergent adverse reactions were reported infrequently (< 2%) in patients receiving **TYGACIL** in Phase 3 clinical studies:

**Body as a Whole:** injection site inflammation, injection site pain, injection site reaction, injection site edema, injection site phlebitis.

**Cardiovascular System:** thrombophlebitis.

**Digestive System:** anorexia, jaundice.

**Metabolic / Nutritional System:** bilirubinemia.

**Hemic and Lymphatic System:** prolonged activated partial thromboplastin time (aPTT), prolonged prothrombin time (PT), increased international normalized ratio (INR).

**Skin and Appendages:** pruritus.

For patients who received tigecycline, the following adverse reactions were reported:

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

***Blood and lymphatic system disorders:*** Activated partial thromboplastin time prolonged (aPTT), prothrombin time prolonged (PT), international normalised ratio increased (INR), thrombocytopenia, hypofibrinogenaemia.

***Immune system disorders:*** Anaphylactic reaction /anaphylactoid reactions.

***Metabolism and nutrition disorders:*** Hypoproteinemia, hypoglycaemia, decreased appetite.

***Nervous system disorders:*** Dizziness, headache.

***Vascular disorders:*** Phlebitis, thrombophlebitis.

***Respiratory, thoracic and mediastinal disorders:*** Pneumonia.

***Gastrointestinal disorders:*** Nausea, vomiting, diarrhoea, abdominal pain, dyspepsia, pancreatitis acute.

***Hepatobiliary disorder:*** Aspartate aminotransferase (AST) increased, alanine aminotransferase (ALT) increased\*, hyperbilirubinaemia, jaundice, cholestasis.

\*AST and ALT abnormalities in tigecycline-treated patients were reported more frequently in the post-therapy period than in those in comparator-treated patients, which occurred more often on therapy.

***Skin and subcutaneous tissue disorders:*** Pruritus, rash, severe skin reactions, including Stevens-Johnson Syndrome.

***General disorders and administration site conditions:*** Impaired healing, injection site inflammation, injection site pain, injection site reaction, injection site oedema, injection site phlebitis.

***Investigations:*** Amylase increased, blood urea increased (BUN).

## **OVERDOSAGE**

No specific information is available on the treatment of overdosage with tigecycline. Intravenous administration of **TYGACIL** at a single dose of 300 mg over 60 minutes in healthy volunteers resulted in an increased incidence of nausea and vomiting. In single-dose IV toxicity studies conducted with tigecycline in mice, the estimated median lethal dose (LD<sub>50</sub>) was 124 mg/kg in males and 98 mg/kg in females. In rats, the estimated LD<sub>50</sub> was 106 mg/kg for both sexes. Tigecycline is not removed in significant quantities by hemodialysis.

## **DOSAGE AND ADMINISTRATION**

The recommended dosage regimen for **TYGACIL** is an initial dose of 100 mg, followed by 50 mg every 12 hours. Intravenous (IV) infusions of **TYGACIL** should be administered over approximately 30 to 60 minutes every 12 hours.

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

The recommended duration of treatment with **TYGACIL** for cSSSI or for cIAI is 5 to 14 days. The duration of therapy should be guided by the severity and site of the infection and the patient's clinical and bacteriological progress.

No dosage adjustment is warranted in patients with mild to moderate hepatic impairment (Child Pugh A and Child Pugh B). In patients with severe hepatic impairment (Child Pugh C), the dose of **TYGACIL** should be reduced to 100 mg followed by 25 mg every 12 hours. Patients with severe hepatic impairment (Child Pugh C) should be treated with caution and monitored for treatment response (See **CLINICAL PHARMACOLOGY, Special Populations, Use in Patients with Hepatic Impairment** and **PRECAUTIONS, Use in Patients with Hepatic Impairment**).

No dosage adjustment of **TYGACIL** is necessary in patients with renal impairment or in patients undergoing hemodialysis (See **CLINICAL PHARMACOLOGY, Special Populations, Use in Patients with Renal Impairment**).

Safety and effectiveness in patients under 18 years of age have not been established. Therefore, use in patients under 18 years of age is not recommended (See **WARNINGS**). No dosage adjustment of **TYGACIL** is necessary based on age, gender, or race (See **CLINICAL PHARMACOLOGY, Special Populations, Geriatric Use, Gender, Race** and **PRECAUTIONS Geriatric Use**).

### **Preparation and Handling**

The lyophilized powder should be reconstituted with 5.3 mL of 0.9% Sodium Chloride Injection, USP, or 5% Dextrose Injection, USP, or Lactated Ringer's Injection, USP, to achieve a concentration of 10 mg/mL of tigecycline. The vial should be gently swirled until the drug dissolves. Withdraw 5 mL of the reconstituted solution from the vial and add to a 100 mL IV bag for infusion. For a 100 mg dose, reconstitute using two vials into a 100 mL IV bag. (Note: The vial contains a 6% overage. Thus, 5 mL of reconstituted solution is equivalent to 50 mg of the drug). The reconstituted solution should be yellow to orange in colour; if not, the solution should be discarded. Parenteral drug products should be inspected visually for particulate matter and discoloration (e.g., green or black) prior to administration whenever solution and container permit. Once reconstituted, do not store **TYGACIL** above 25°C for up to 24 hours (up to 6 hours in the vial and the remaining time in the IV bag). Alternatively, tigecycline mixed with 0.9% Sodium Chloride Injection, USP, or 5% Dextrose Injection, USP may be stored refrigerated at 2°C to 8°C (36°F to 46°F) for up to 48 hours following immediate transfer of the reconstituted solution into the IV bag.

If the storage conditions exceed 25°C/77°F after reconstitution, tigecycline should be used immediately.

**TYGACIL** may be administered intravenously through a dedicated line or through a Y-site. If the same intravenous line is used for sequential infusion of several drugs, the line should be flushed before and after infusion of **TYGACIL** with either 0.9% Sodium Chloride Injection, USP, or 5% Dextrose Injection, USP. Injection should be made with

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**  
CDS Effective Date: February 01, 2022  
Supersedes: December 01, 2020  
Approved by BPOM: July 18, 2024

an infusion solution compatible with tigecycline and with any other drug(s) administered via this common line (See **Compatibilities/Incompatibilities**).

### **Compatibilities/Incompatibilities**

Compatible intravenous solutions include 0.9% Sodium Chloride Injection, USP, and 5% Dextrose Injection, USP, and Lactated Ringer's Injection, USP. When administered through a Y-site, **TYGACIL** is compatible with the following drugs or diluents when used with either 0.9% Sodium Chloride Injection, USP, or 5% Dextrose Injection, USP and administered simultaneously through the same line: amikacin, dobutamine, dopamine HCl, gentamicin, haloperidol, Lactated Ringer's, lidocaine HCl, metoclopramide, morphine, norepinephrine, piperacillin/tazobactam (EDTA formulation), potassium chloride, propofol, ranitidine HCl, theophylline and tobramycin.

The following drugs should not be administered simultaneously through the same Y-site as **TYGACIL**: amphotericin B, amphotericin B lipid complex, diazepam, esomeprazole and omeprazole.

### **ANIMAL TOXICOLOGY**

Decreased erythrocytes, reticulocytes, leukocytes, and platelets, in association with bone marrow hypocellularity, have been seen with tigecycline at exposures of 8.1 times and 9.8 times the human daily dose based on AUC in rats and dogs, respectively. These alterations were shown to be reversible after two weeks of dosing.

Bolus intravenous administration of tigecycline has been associated with a histamine response in preclinical studies. These effects were observed at exposures of 14.3 and 2.8 times the human daily dose based on AUC in rats and dogs, respectively.

No evidence of photosensitivity was observed in rats following administration of tigecycline.

### **CLINICAL STUDIES**

#### **Complicated Skin and Skin Structure Infections (cSSSI)**

**TYGACIL** was evaluated in adults for the treatment of cSSSI in two randomized, double-blind, active-controlled, multinational, multicenter studies. These studies compared **TYGACIL** (100 mg IV initial dose followed by 50 mg every 12 hours) with vancomycin (1 g IV every 12 hours)/aztreonam (2 g IV every 12 hours) for 5 to 14 days. Subjects with complicated deep soft tissue infections including wound infections and cellulitis ( $\geq 10$  cm, requiring surgery/drainage or with complicated underlying disease), major abscesses, infected ulcers, and burns were enrolled in the studies. The primary efficacy endpoint was the clinical response at the test of cure (TOC) visit in the co-primary populations of the clinically evaluable (CE) and clinical modified intent-to-treat (c-mITT) subjects. See Table 6.

**Table 6. Clinical Cure Rates from Two Pivotal Studies in cSSSI after 5 to 14 Days of Therapy**

	TYGACIL <sup>a</sup> n/N (%)	Vancomycin / Aztreonam <sup>b</sup> n/N (%)
CE	365 / 422 (86.5)	364 / 411 (88.6)
c-mITT	429 / 538 (79.7)	425 / 519 (81.9)

<sup>a</sup> 100 mg initially, followed by 50 mg every 12 hours

<sup>b</sup> Vancomycin (1 g IV every 12 hours) / Aztreonam (2 g IV every 12 hours)

Clinical cure rates at TOC by pathogen in the ME subjects with cSSSI are presented in Table 7.

**Table 7. Clinical Cure Rates by Infecting Pathogen in ME Subjects with cSSSI<sup>a</sup>**

Pathogen	TYGACIL n/N (%)	Vancomycin / Aztreonam n/N (%)
<i>Escherichia coli</i>	29/ 36(80.6)	26/30 (86.7)
<i>Enterobacter cloacae</i>	10/12 (83.3)	15/15 (100)
<i>Enterococcus faecalis</i> (vancomycin-susceptible only)	15/21 (71.4)	19/24 (79.2)
<i>Klebsiella pneumoniae</i>	12/14 (85.7)	15/16 (93.8)
Methicillin-susceptible <i>Staphylococcus aureus</i> (MSSA) <sup>b</sup>	124/137 (90.5)	113/120 (94.2)
Methicillin-resistant <i>Staphylococcus aureus</i> (MRSA) <sup>b</sup>	79/95 (83.2)	46/57 (80.7)
CA-MRSA <sup>c</sup>	13/20 (65.0)	10/12 (83.3)
<i>Streptococcus agalactiae</i>	8/8 (100)	11 / 14 (78.6)
<i>Streptococcus anginosus</i> grp. <sup>d</sup>	17/21 (81.0)	9/10 (90.0)
<i>Streptococcus pyogenes</i>	31/32 (96.9)	24/27 (88.9)
<i>Bacteroides fragilis</i>	7/9 (77.8)	4/5 (80.0)

<sup>a</sup> Two cSSSI pivotal studies and two Phase 3 Resistant Pathogen study

<sup>b</sup> Includes cases of concurrent bacteremia

<sup>c</sup> CA-MRSA = community acquired MRSA isolates that bear molecular and virulence markers commonly associated with community acquired MRSA including the SCCmec type IV element and the *pvl* gene

<sup>d</sup> Includes *Streptococcus anginosus*, *Streptococcus intermedius*, and *Streptococcus constellatus*

### Complicated Intra-abdominal Infections (cIAI)

**TYGACIL** was evaluated in adults for the treatment of cIAI in two randomized, double-blind, active-controlled, multinational, multicenter studies. These studies compared **TYGACIL** (100 mg IV initial dose followed by 50 mg every 12 hours) with imipenem / cilastatin (500 mg IV every 6 hours) for 5 to 14 days. Subjects with complicated diagnoses including appendicitis, cholecystitis, diverticulitis, gastric/duodenal perforation, intra-abdominal abscess, perforation of the intestine, and peritonitis were enrolled in the studies. The primary efficacy endpoint was the clinical response at the TOC visit for the co-primary populations of the ME and the microbiologic modified intent-to-treat (m-mITT) subjects. See Table 8.

**Table 8. Clinical Cure Rates from Two Pivotal Studies in cIAI after 5 to 14 Days of Therapy**

	TYGACIL <sup>a</sup> n/N (%)	Imipenem / Cilastatin <sup>b</sup> n/N (%)
ME	441 / 512 (86.1)	442 / 513 (86.2)
m-mITT	506 / 631 (80.2)	514 / 631 (81.5)

<sup>a</sup> 100 mg initially, followed by 50 mg every 12 hours

<sup>b</sup> Imipenem/Cilastatin (500 mg every 6 hours)

Clinical cure rates at TOC by pathogen in the ME subjects are presented in Table 9.

**Table 9. Clinical Cure Rates by Infecting Pathogen in ME Subjects with cIAI<sup>a</sup>**

Pathogen	TYGACIL n/N (%)	Imipenem / Cilastatin n/N (%)
<i>Citrobacter freundii</i>	12/16 (75.0)	3/4 (75.0)
<i>Enterobacter cloacae</i>	15/17 (88.2)	16/17 (94.1)
<i>Escherichia coli</i>	284/336 (84.5)	297/342 (86.8)
<i>Klebsiella oxytoca</i>	19/20 (95.0)	17/19 (89.5)
<i>Klebsiella pneumoniae</i> <sup>b</sup>	42/47 (89.4)	46/53 (86.8)
<i>Enterococcus faecalis</i>	29/38 (76.3)	35/47 (74.5)
Methicillin-susceptible		
<i>Staphylococcus aureus</i> (MSSA) <sup>c</sup>	26/28 (92.9)	22/24 (91.7)
Methicillin-resistant		
<i>Staphylococcus aureus</i> (MRSA)	16/18 (88.9)	1/3 (33.3)
<i>Streptococcus anginosus</i> grp. <sup>d</sup>	101/119 (84.9)	60/79 (75.9)
<i>Bacteroides fragilis</i>	68/88 (77.3)	59/73 (80.8)
<i>Bacteroides thetaiotaomicron</i>	36/41 (87.8)	31/36 (86.1)
<i>Bacteroides uniformis</i>	12/17 (70.6)	14/16 (87.5)
<i>Bacteroides vulgatus</i>	14/16 (87.5)	4/6 (66.7)
<i>Clostridium perfringens</i>	18/19 (94.7)	20/22 (90.9)
<i>Peptostreptococcus micros</i>	13/17 (76.5)	8/11 (72.7)

<sup>a</sup> Two cIAI pivotal studies and two Phase 3 Resistant Pathogen studies

<sup>b</sup> Includes ESBL producing isolates

<sup>c</sup> Includes cases of concurrent bacteremia

<sup>d</sup> Includes *Streptococcus anginosus*, *Streptococcus intermedius*, and *Streptococcus constellatus*

### **Methicillin-Resistant *Staphylococcus aureus* (MRSA) and Vancomycin-Resistant *Enterococcus* (VRE) spp.**

**TYGACIL** was evaluated in adults for the treatment of various serious infections (cIAI, cSSSI, and other infections) due to VRE and MRSA in Study 307. Study 307 was a randomized, double-blind, active-controlled, multinational, multicenter study evaluating **TYGACIL** (100 mg IV initial dose followed by 50 mg every 12 hours) and vancomycin (1 g IV every 12 hours) for the treatment of infections due to MRSA and evaluating **TYGACIL** (100 mg IV initial dose followed by 50 mg every 12 hours) and linezolid (600 mg IV every 12 hours) for the treatment of infections due to VRE for 7 to 28 days. Subjects with cIAI, cSSSI, and other infections were enrolled in this study. The primary efficacy endpoint was the clinical response at the TOC visit for the co-primary

populations of the ME and the m-mITT patients. For clinical cure rates see Table 10 for MRSA and Table 11 for VRE.

**Table 10. Clinical Cure Rates from Resistant Pathogen Study 307<sup>a</sup> for MRSA after 7 to 28 Days of Therapy**

cIAI	1/1 (100.0)	0/1 (0.0)
cSSSi	1/1 (100.0)	2/2 (100.0)
m-mITT	3/8 (37.5)	2/3 (66.7)
cIAI	1/2 (50.0)	0/1 (0.0)
cSSSi	1/2 (50.0)	2/2 (100.0)

<sup>a</sup> Study included subjects with cIAI, cSSSi, and other infections.

<sup>b</sup> 100 mg initially, followed by 50 mg every 12 hours

<sup>c</sup> Linezolid (600 mg IV every 12 hours)

### Resistant Gram-Negative Pathogens

**TYGACIL** was evaluated in adults for the treatment of various serious infections (cIAI, cSSSi, CAP, and other infections) due to resistant gram-negative pathogens in Study 309. Study 309 was an open-label, multinational, multicenter study evaluating **TYGACIL** (100 mg IV initial dose followed by 50 mg every 12 hours) for the treatment of infections due to resistant gram-negative pathogens for 7 to 28 days. Subjects with cIAI, cSSSi, CAP, and other infections were enrolled in this study. The primary efficacy endpoint was the clinical response at the TOC visit for the co-primary populations of the ME and the m-mITT subjects. See Table 12.

Generic Name: Tigecycline  
Trade Name: **TYGACIL™**

Approved by BPOM: July 18, 2024

**Table 12. Clinical Cure Rates from Resistant Pathogen Study 309<sup>a</sup> for Resistant Gram-negative Pathogens after 7 to 28 Days of Therapy**

Study 309	All <sup>c</sup>	TYGACIL <sup>b</sup>	TYGACIL <sup>b</sup>	TYGACIL <sup>b</sup>
		N/N (%)	N/N (%)	N/N (%)
		<i>E. coli</i>	<i>Klebsiella pneumoniae</i>	<i>Enterobacter spp.</i>
ME	26/36 (72.2)	4/9 (44.4)	5/6 (83.3)	3/4 (75.0)
cIAI	2/2 (100.0) <sup>d</sup>	1/1 (100.0) <sup>d</sup>	1/1 (100.0)	-
cSSSI	20/24 (83.3)	3/5 (60.0)	3/3 (100.0)	3/3 (100.0)
CAP	0/1 (0.0)	-	-	0/1 (0.0)
m-mITT	40/75 (53.3)	5/10 (50.0)	9/13 (69.2)	8/15 (53.3)
cIAI	6/9 (66.7) <sup>d</sup>	2/2 (100.0) <sup>d</sup>	1/1 (100.0)	1/1 (100.0) <sup>d</sup>
cSSSI	27/38 (71.1)	3/5 (60.0)	6/7 (85.7)	7/8 (87.5)
CAP	0/1 (0.0)	-	-	0/1 (0.0)

<sup>a</sup> Study included subjects with cIAI, cSSSI, CAP and other infections.  
<sup>b</sup> 100 mg initially, followed by 50 mg every 12 hours  
<sup>c</sup> Includes other pathogens besides *E. coli*, *Klebsiella pneumoniae*, and *Enterobacter spp.*  
<sup>d</sup> Excludes subjects with inadequate source control

### Cardiac Electrophysiology

No significant effect of a single intravenous dose of tigecycline 50 mg or 200 mg on QTc interval was detected in a randomized, placebo- and active-controlled four-arm crossover thorough QTc study of 46 healthy subjects.

### HOW SUPPLIED

**TYGACIL** (tigecycline) for injection is supplied in a single-dose 5 mL glass vial containing 50 mg lyophilized powder for infusion.

Supplied 10 vials/box.

### Storage

Prior to reconstitution, store **TYGACIL** below 30°C. Reconstituted solution must be immediately transferred and further diluted for IV infusion. Once reconstituted, do not store **TYGACIL** above 25°C for up to 24 hours (up to 6 hours in the vial and the remaining time in the IV bag). Alternatively, **TYGACIL** mixed with 0.9% Sodium Chloride Injection, USP, or 5% Dextrose Injection, USP may be stored refrigerated at 2° to 8°C (36° to 46°F) for up to 48 hours following immediate transfer of the reconstituted solution into IV bag.

Shelf life is 24 months from the date of manufacture.
